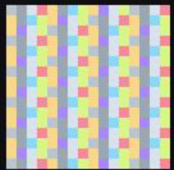
Digit frames

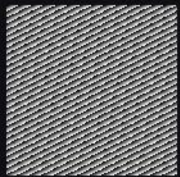
a gallery of the pictures this project renders

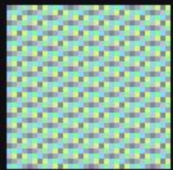
Each picture is a window on a stream of digits, or on an arithmetic function, drawn one pixel to the value. The families below are produced by the scripts of scripts/, and each is governed by a Lean file that fixes what may appear in it: which stream, which window, which colour, and — for the enlargements — exactly when a repetition is the true frame and when it is only a pattern.

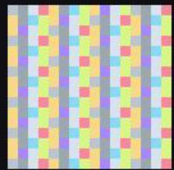
720 pictures · 22 families · 2026-08-26

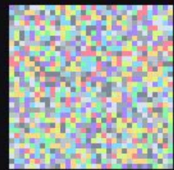
Vector companion: gallery/svg/ — exact rectangle copies of the frames, modelled and proved faithful in RequestProject/SvgExport.lean.

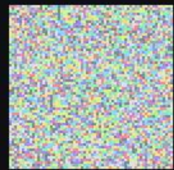


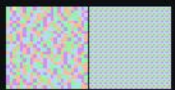


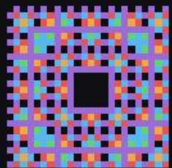


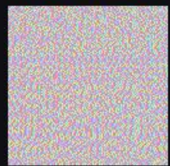


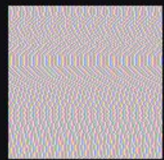


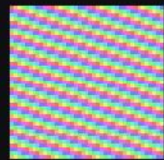


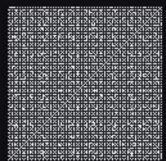


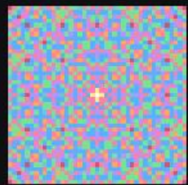


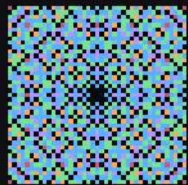


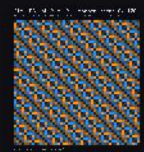


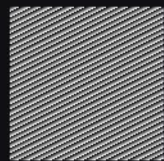












Contents

720 pictures in all.

The registry at poster size

`frames_big_oeis/` · `RequestProject/Magnify.lean` · `sheet 1 of 11`

Every generator of the registry rendered straight to poster size: the window magnified by an integer factor, and — for the periodic sources only — the period window duplicate-filled across the canvas. The fill is used exactly where `tileView_windowPattern_eq_windowPattern` says it reproduces the true frame; the aperiodic sources are only ever magnified.

frames_big/ · RequestProject/Magnify.lean · sheet 1 of 16

Nearest-neighbour magnification of all the small frames below, at an integer factor, so each original pixel becomes a solid square block: nothing is interpolated, nothing is invented, and the original frame can be read straight back off the enlargement.

OEIS generators

frames_oeis/ · RequestProject/OeisRegistry.lean ·

One frame per sequence per window size, each pixel the value of a function at `i*n + j`. No file is read, so no pixel can be black.

frames_generated/ · RequestProject/FixedRender.lean · sheet 1 of 2

Digit streams generated inside Lean with a proved error term: every pixel is provably the colour of the corresponding decimal digit of the constant. The stream is sanitised before it is reshaped, so no separator can reach a pixel and no pixel can be black.
